

Insurance Distribution Platform

Phase 4 – Business Rules, Information Model & Governance (v0.1)

Purpose

This document defines the enterprise business rules, canonical information domains, governance model, decision ownership, and traceability approach for the Insurance Distribution Platform. It provides the bridge between business processes and the future solution architecture while remaining technology-neutral.

1. Business Rule Categories

Category	Examples
Lead	Creation, ownership, assignment, expiry, merge, reopen
Consent	Capture, versioning, validity, withdrawal, audit
Suitability	Eligibility, recommendation, override, versioning
Product	Availability, insurer mapping, effective dates
Quote	Validity, refresh, comparison, selection
Proposal	Mandatory fields, save/resume, submission
Underwriting	Medical, document review, insurer decisions
Payment	Retry, reconciliation, settlement
Policy	Issuance, activation, servicing, renewal
Security	Authentication, authorization, audit, retention

2. Canonical Business Information Model

Customer

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Relationship Manager

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Lead

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Consent

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Suitability Assessment

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Product Catalogue

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Quote

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Proposal

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Underwriting Case

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Payment

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Policy

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Communication

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Audit Event

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Reporting Metric

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

Partner Insurer

Purpose: Defines a canonical business object independent of implementation. Each domain will later include ownership, lifecycle, identifiers, business attributes, validation rules, relationships, audit requirements and retention policy.

3. Governance & Decision Ownership

Area	Business Owner	Decision Authority
Products	Product Team	Product launch, retirement, availability
Suitability	Business & Compliance	Rules and recommendation policy
Lead	Sales	Assignment and lifecycle
Consent	Compliance	Consent wording and validity
Integration	Technology & Partner Team	Partner onboarding
Reporting	Business Intelligence	KPI definitions
Security	Information Security	Access and audit policies

4. Requirement Traceability

Every requirement shall be traceable using the following chain:

Business Vision → Capability → Business Requirement → Business Rule → Business Process → Information Object → Functional Specification → API → Test Case → KPI

5. Standard Business Rule Template

Field	Description
Rule ID	Unique identifier (e.g. BR-RULE-001)
Rule Name	Business-friendly name
Business Statement	The actual rule
Applies To	Capability / Journey
Trigger	Business event
Validation	Acceptance conditions
Exception	Failure handling
Owner	Business owner
Priority	P0 / P1 / P2
Audit	Evidence captured

6. Information Governance Principles

- Maintain a canonical business vocabulary across all integrations.
- Business identifiers remain stable regardless of integration provider.
- Configuration should be preferred over code wherever possible.
- Every state transition must be auditable.
- Business rules must be version-controlled.
- PII classification and retention policies shall be defined per information object.
- All regulatory evidence shall be traceable.

7. Deliverables for Phase 5

Phase 5 will transform the approved business repository into a solution architecture including bounded contexts, domain model, integration architecture, APIs, security architecture, deployment principles and implementation roadmap.
