

Insurance Distribution Platform

Phase 5 – Solution Architecture Blueprint (v0.1)

Document Objective

This document translates the approved business architecture into a technology-neutral solution architecture blueprint. It defines architectural building blocks, domain boundaries, integration principles, information ownership and implementation guidance. It intentionally avoids detailed class design and code while establishing the enterprise architecture baseline.

1. Architecture Principles

- Business capabilities drive system boundaries.
- Domain ownership is explicit; every business entity has a single system of record.
- Canonical APIs shield business domains from insurer-specific implementations.
- Integration providers (1SB initially, direct insurers later) are replaceable.
- Configuration is preferred over hard-coded business rules.
- All business events are auditable and traceable.
- Security, privacy and regulatory compliance are built into every capability.

2. Proposed Business Domains

Domain	Responsibilities
Identity & Access	Authentication, SSO, authorization, RM identity.
Customer	Customer profile, contacts, preferences.
Lead Management	Lead lifecycle, assignment, tracking.
Consent	Consent capture, versioning, evidence.
Suitability	Assessment, recommendation and decision support.
Product Catalogue	Products, insurers, eligibility, product matrix.
Quote	Quote requests, comparison and selection.
Proposal	Proposal creation and submission.
Underwriting	Tracking, medical status, insurer decisions.
Payments	Premium collection and reconciliation.
Policy	Issuance, servicing, renewals.
Communications	SMS, email, notifications, templates.
Reporting	Operational, MIS and executive dashboards.
Administration	Configuration, business rules, reference data.
Integration Hub	1SB adapters today, direct insurer adapters tomorrow.
Audit & Compliance	Audit trail, regulatory evidence, logs.

3. Enterprise Integration Strategy

Phase A: Platform integrates with 1SilverBullet for supported insurers.

Phase B: New insurer integrations can coexist alongside 1SB.

Phase C: Direct insurer integrations progressively replace 1SB where commercially and technically feasible.

The business domains remain unchanged across all phases because integrations are isolated behind the Integration Hub.

4. Canonical Request Flow

- RM authenticates through bank identity services.
- Lead is created within the platform.
- Consent is captured and stored.
- Suitability assessment determines customer needs.
- Product Catalogue identifies eligible products.
- Integration Hub routes requests to the appropriate insurer capability.
- Quote, proposal, underwriting and payment progress through the platform.
- Policy issuance status is captured and reported.

5. Cross-Cutting Architecture Concerns

Concern	Expected Outcome
Security	Role-based access, encryption, audit.
Availability	Highly available business services.
Performance	Responsive RM and customer journeys.
Observability	Monitoring, tracing and operational dashboards.
Configuration	Business rules managed without code changes.
Compliance	IRDAI and bank governance support.
Scalability	Support additional insurers and products.

6. Target Deliverables from this Blueprint

- Detailed domain model
- Context map and bounded contexts
- API catalogue
- Canonical data model
- Integration specifications
- Security architecture
- Deployment architecture
- Operational architecture
- Implementation roadmap
- Testing strategy

7. Exit Criteria for Phase 5

Phase 5 is complete when business domains, architectural principles, integration strategy, information ownership and enterprise boundaries are approved. Subsequent phases will elaborate detailed solution design, APIs, data models and implementation artefacts.
